

OHMIC STEAM CHANGES THE GAME

What happens when two truly innovative companies form a partnership? Innovation, maybe? Wood Stone, the stone-hearth cooking people, and Ideas Well Done, advanced concept developers, have teamed up to produce Ohmic Green Technologies. Two of the new products are ohmic steamers. The basic idea: Pass an electric current directly through water, which instantly, simply and energy-efficiently creates heat that turns the water to steam. Instant on, instant off, without the usual energy losses of idling, mechanical losses, etc. Simple design means simple cleaning. A removable-container steamer works with, for example, standard steam pans or fractional, or other containers. A reservoir steamer uses pulsed or constant steam to let you do portion steaming, retherm, etc.
